

Usability and Accessibility Report

Product Name: **SkaleChat**

Date: 03/07/2026

Version: 1

Categories and Criteria

- The Findings in this report are organised into the following categories for clarity and ease of prioritisation
 - **Information Architecture:** Concerns related to how content and features are structured, labelled, and organised across the platform.
 - **Navigation:** Concerns related to how users move through the platform
 - **Forms & Interaction:** Concerns related to how users interact with the platform
 - **Design & Layout:** Concerns related to the visual presentation of the platform
 - **Mobile & Responsiveness:** Concerns about how the platform performs and renders across different screen sizes and devices.
 - **Legal & Compliance:** Concerns related to the presence and accessibility of legally required documentation and policies.
 - **Trust & Credibility:** Concerns related to features and content that establish user confidence in the platform.
 - **Web Content Accessibility Guidelines** are internationally recognised standards for making digital content more accessible. The success criteria are broken down into three levels of accessibility.
 - **Level A** - minimum requirement, must be met.
 - **Level AA** - standard compliance target for most products.
 - **Level AAA** - highest level, not always feasible to achieve fully.
-

Findings

- **App icon shifts/jitters between two variations during splash/load**
Category: Design & Layout

⇒ Looks like an unintended asset swap or animation glitch rather than deliberate motion.

- **Word wrap breaks mid-word ("SkaleCha" / "t")**
Category: Design & Layout
Success Criteria: WCAG 1.4.10 – Reflow (Level AA)
- **Minor copy issue: "Let's Setup your account" should read "Let's set up your account"**
Category: Design & Layout
⇒ "Setup" is a noun; the verb form "set up" is grammatically correct here.
- **No onboarding progress indicator (step count/dots)**
Category: Navigation
⇒ Users can't tell how many steps are ahead in account setup.

- **"Next" CTA overlaps and obscures the phone number input field entirely.**
Category: Forms & Interaction
Success Criteria: WCAG 1.3.1 – Info and Relationships (Level A)/ 2.4.7 – Focus

Visible (Level AA)

⇒ The number entry field appears rendered underneath the button, leaving users no visible way to type their phone number. This blocks the task entirely, not just a

cosmetic issue.

- **"Done" CTA overlaps 4 of the 6 OTP input boxes**

Category: Forms & Interaction

Success Criteria: WCAG 1.3.1 – Info and Relationships (Level A) / 2.4.7 – Focus Visible (Level AA)

⇒ Users cannot see or tap the covered OTP boxes, making manual code entry impossible on this layout.

- **"Done" button also overlaps "Didn't Received yet?" link, making it unreadable/untappable**

Category: Forms & Interaction

⇒ Same overlap issue removes access to the resend flow, not just the code entry.

- **"Resend Code" label and "Get Code on call" button text appear stacked/overlapping**

Category: Design & Layout

⇒ Unclear which is a heading vs. a tappable action; visual hierarchy is broken here.

- **Grammar: "Didn't Received yet?" should read "Didn't receive it yet?"**

Category: Design & Layout

- **Capitalized mid-sentence: "Check your Messages." — "Check your messages"**
Category: Design & Layout

- **Attachment menu icons are small relative to available space, with an uneven 5+2 grid**

Category: Design & Layout / Forms & Interaction

Success Criteria: WCAG 2.5.8 – Target Size Minimum (Level AA)

⇒ Two rows (5 then 2) leaves a lot of unused horizontal space in the second row while the icons stay compact — sizing them up would both improve tap accuracy and make better use of the layout. Consider a more evenly spaced grid (e.g., 4+3) if more items are added later.

- **"Notifications" repeated as both a quick-action icon and a list item**
Category: Information Architecture
 Success Criteria: WCAG 2.4.6 – Headings and Labels (Level AA)
 ⇒ If both go to the same place, consolidate into one entry point. If they're actually different (e.g., bell = quick mute toggle, list item = full notification settings), the icon needs a distinguishing label — right now nothing differentiates their purpose.
- **Quick-action icons (call, video, bell, search) have no visible text labels**
Category: Forms & Interaction
 Success Criteria: WCAG 1.1.1 – Non-text Content (Level A) / 4.1.2 – Name, Role, Value (Level A)
 ⇒ Inconsistent with the list section below, where every row has a text label.
 Icon-only controls should at minimum expose an accessible name.

- **Greeting text ("Hi, Shruti") uses a different font from the rest of the UI.**
Category: Design & Layout
 ⇒ Suggests no single type system is being applied consistently — worth checking if this is a one-off style override or a broader pattern across screens.

- **Light/dark mode toggle duplicated: quick-access button on the Home header AND a full setting under Settings > Chats > Display.**

Category: Information Architecture

Success Criteria: WCAG 2.4.6 – Headings and Labels (Level AA)

⇒ Two separate entry points for the same theme control create redundancy and

potential inconsistency (e.g., if one updates state and the other doesn't reflect it immediately). If the home header toggle is meant as a convenience shortcut, that's reasonable, but it should stay in sync with the Settings entry rather than existing as a fully duplicate control — worth clarifying which is the source of truth.

- **Three separate "add/compose" entry points visible at once (green "+" top right, "Add status" circle, blue FAB at bottom)**

Category: Information Architecture

⇒ Each looks like it starts something different, but nothing distinguishes the green one's purpose at a glance.

- **Bottom icon cluster (phone, stack icon, FAB, chat bubble, avatar) has no labels.**

Category: Navigation

Success Criteria: WCAG 2.4.6 – Headings and Labels (Level AA)

- **Icon rendering quality — some icons pixelated, others crisp.**

Category: Design & Layout

⇒ The phone icon appears to be a proper vector/SVG asset, while the brand "S" icons look like raster images (PNG/JPEG) scaled up without adequate resolution for the display density. Likely fix: export these as vector assets or provide proper @2x/@3x raster resolutions so they scale cleanly across device pixel densities.

- **Uneven gap between avatar image and its surrounding ring/outline.**

Category: Design & Layout

⇒ The avatar appears to float inside the ring rather than being sized/cropped to sit flush against it — likely an asset sizing or padding mismatch in the avatar component, giving it an unfinished look.

- **Archive folder icon is present, but there's no visible mechanism to actually archive a chat.**

Category: Information Architecture

⇒ The archive icon (top right of the chat list) implies chats can be moved there, but there's no swipe gesture, long-press menu, or per-chat control shown to perform that action — the feature is discoverable but not actionable.

- **Empty state says "Start a voice or video call from any chat", but this screen offers no contacts list or CTA to initiate one**

Category: Navigation

⇒ Users landing on the Calls tab with no history hit a dead end — the instruction points them elsewhere ("any chat") instead of letting them act from here, which is inconsistent with the tab's stated purpose.

- **No "New Call" entry point on the Calls tab, unlike the Chats tab's compose FAB**

Category: Information Architecture

⇒ The bottom FAB stays the same generic compose icon regardless of tab — Calls would benefit from its own equivalent action (e.g., a contact picker to start a call directly) rather than relying on users to remember to back out to a chat.

- **Label "Allow photo access" reads like a system permission prompt, not a menu action (inconsistent with sibling label "Camera")**

Category: Design & Layout

⇒ If this is meant to be "Gallery"/"Photos" until permission is granted, consider a consistent label with a secondary permission cue instead, so the grid item naming stays consistent regardless of permission state.

- **Circular icon targets sit very close together with minimal gap between them**

Category: Forms & Interaction

⇒ Even if each circle individually meets minimum target size, tight spacing between adjacent targets increases the risk of mis-taps — worth making the pill container holding the 4 icons doesn't span full width, like the full-width panel directly below it

- **No resize handles or pinch-to-scale control for text/emoji overlays once placed.**

Category: Forms & Interaction

⇒ The emoji and "Navadeep" text overlay show no visible handles (corner grips, bounding box) indicating they can be resized or rotated — even if the underlying gesture exists, there's no affordance communicating it's possible.

- **Placed text cannot be re-opened/edited afterward**

Category: Forms & Interaction

⇒ Once text like "Navadeep" is placed on the status, there's no tap-to-edit interaction shown — users must delete and retype rather than adjust wording, sizing, or position, which is a meaningful gap for a content-creation flow like this.

- **Dialog boxes use the native system instead of a custom-branded one.**

Category: Design & Layout

⇒ Breaks visual continuity — the teal system buttons and generic styling stand out against the app's established purple/lime design language, making this moment feel like it belongs to a different app.

- **"Chat lock" label implies a toggle, but it's actually a navigable list of locked chats.**

Category: Information Architecture

Success Criteria: WCAG 2.4.6 – Headings and Labels (Level AA)

⇒ Renaming to "Locked Chats" or "Chat Locker" would better match what's actually inside and disambiguate it.

- **"No contacts match" message is shown even though contacts integration isn't connected, misrepresenting the actual system state.**

Category: Forms & Interaction

Success Criteria: WCAG 3.3.1 – Error Identification (Level A) / 4.1.3 – Status Messages (Level AA)

⇒ The empty state implies the search ran against real contact data and found nothing, when the actual issue is missing permission/connection. Users have no path to fix the real problem (e.g., a prompt to grant contacts access) because the message doesn't reflect what's actually wrong.

- **User Policy page is entirely blank — no content rendered.**

Category: Legal & Compliance

Success Criteria: WCAG 1.3.1 – Info and Relationships (Level A)

⇒ Given SkaleChat handles personal messages, contacts, and status content, an absent or unpopulated policy page is a critical gap.

- **"Contact Us" email routes to support@slaychatapp.com instead of a SkaleChat-branded address.**
Category: Trust & Credibility
Success Criteria: WCAG 1.3.1 – Info and Relationships (Level A)
- **"Terms and Privacy Policy" link leads to slaychatapp.com, which returns "Page Not Found"**
Category: Legal & Compliance
Success Criteria: WCAG 1.3.1 – Info and Relationships (Level A)
⇒ Sending a support request to a mismatched domain name undermines credibility. "SlayChatApp" might be the misconfigured link that was never updated to match the current brand.
- **The linked domain itself is an undeveloped placeholder, still showing the GoDaddy Airo website-builder promo banner ("Try Airo AI Builder — Start for free")**
Category: Trust & Credibility

Summary

- While SkaleChat demonstrates a functional core chat experience, this review surfaced several usability and accessibility concerns that would benefit from remediation before further rollout.
- The most critical issues are the CTA-overlap bugs on the Phone Number and OTP verification screens, which block core onboarding tasks outright (users cannot see or enter their number, or read/tap OTP fields) — these should be treated as blocking defects rather than polish items, given they sit at the very start of the user journey.
- The Legal & Compliance gaps compound one another: the in-app "User Policy" page renders blank, and the "Terms and Privacy Policy" / "Contact Us" links under Help both route to a mismatched, undeveloped external domain (slaychatapp.com) showing a website-builder placeholder. Given the sensitive nature of personal messages and contacts this app handles, these should be prioritised independently and with urgency.
- Several findings point to an absence of a consistent design system — mismatched fonts, pixelated icons alongside vector ones, uneven/asymmetric grids, disproportionate whitespace, and a native system dialog breaking from the app's branded visual language. Establishing shared type, spacing, and component standards would resolve a large share of these individually noted issues at once.
- A few findings — the Calls tab dead-end, and the contacts "no results" state misrepresenting a missing integration — reflect incomplete or in-progress features rather than design flaws, and should be validated against the current build/roadmap before being treated as defects.
